Edge 2016
The Premier IT Infrastructure Conference
Outthink status quo.

© 2016 IBM Corporation #ibmedge IBM

Agenda

- Part 1
 - CPU
 - Memory tuning
 - Starter Set of Tunables
- Part 2
 - I/O
 - **Volume Groups and File systems**
 - AIO and CIO
- Part 3
 - Network
 - Performance Tools

2 

I/O

3

Rough Anatomy of an I/O

- LVM requests a PBUF
 - Pinned memory buffer to hold I/O request in LVM layer
- Then placed into an FSBUF
 - 3 types
 - These are also pinned
 - Filesystem JFS
 - Client NFS and VxFS
 - External Pager JFS2
- If paging then need PSBUFs (also pinned)
 - Used for I/O requests to and from page space
- Then queue I/O to an hdisk (queue_depth)
- Then queue it to an adapter (num_cmd_elems)
- Adapter queues it to the disk subsystem
- Additionally, every 60 seconds the sync daemon (syncd) runs to flush dirty I/O out to filesystems or page space

4

From: AIX/VIOS Disk and Adapter IO Queue Tuning v1.2 – Dan Braden, July 2014

AIX IO Stack – Basic Tunables

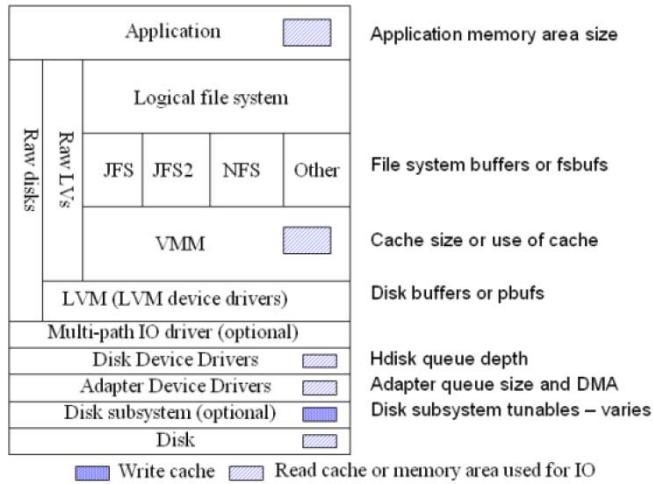

Figure 1 - AIX IO stack and basic tunables

5

IO Wait and why it is not necessarily useful

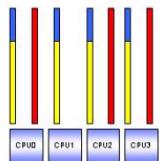

SMT2 example for simplicity

System has 7 threads with work, the 8th has nothing so is not shown

System has 3 threads blocked (red threads)

SMT is turned on

There are 4 threads ready to run so they get dispatched and each is using 80% user and 20% system

Metrics would show:

%user = .8 * 4 / 4 = 80%

%sys = .2 * 4 / 4 = 20%

Idle will be 0% as no core is waiting to run threads

IO Wait will be 0% as no core is idle waiting for IO to complete as something else got dispatched to that core

SO we have IO wait

BUT we don't see it

Also if all threads were blocked but nothing else to run then we would see IO wait that is very high

6

What is iowait? Lessons to learn

- iowait is a form of idle time
- It is simply the percentage of time the CPU is idle AND there is at least one I/O still in progress (started from that CPU)
- The iowait value seen in the output of commands like vmstat, iostat, and topas is the iowait percentages across all CPUs averaged together
 - **This can be very misleading!**
- High I/O wait does not mean that there is definitely an I/O bottleneck
- Zero I/O wait does not mean that there is not an I/O bottleneck
- A CPU in I/O wait state can still execute threads if there are any runnable threads

7

Basics

- **Data layout will have more impact than most tunables**
- Plan in advance
- **Large hdisk are evil**
 - I/O performance is about bandwidth and reduced queuing, not size
 - 10 x 50gb or 5 x 100gb hdisk are better than 1 x 500gb
 - Also larger LUN sizes may mean larger PP sizes which is not great for lots of little filesystems
 - Need to separate different kinds of data i.e. logs versus data
- **The issue is queue_depth**
 - In process and wait queues for hdisk
 - In process queue contains up to queue_depth I/Os
 - hdisk driver submits I/Os to the adapter driver
 - Adapter driver also has in process and wait queues
 - SDD and some other multi-path drivers will not submit more than queue_depth IOs to an hdisk which can affect performance
 - Adapter driver submits I/Os to disk subsystem
 - Default client qdepth for vSCSI is 3
 - chdev -l hdisk? -a queue_depth=20 (or some good value)
 - Default client qdepth for NPIV is set by the Multipath driver in the client

8

More on queue depth

- Disk and adapter drivers each have a queue to handle I/O
- Queues are split into in-service (aka in-flight) and wait queues
- IO requests in in-service queue are sent to storage and slot is freed when the IO is complete
- IO requests in the wait queue stay there till an in-service slot is free
- queue depth is the size of the in-service queue for the hdisk
 - Default for vSCSI hdisk is 3
 - Default for NPIV or direct attach depends on the HAK (host attach kit) or MPIO drivers used
- num_cmd_elems is the size of the in-service queue for the HBA
- Maximum in-flight IOs submitted to the SAN is the smallest of:
 - Sum of hdisk queue depths
 - Sum of the HBA num_cmd_elems
 - Maximum in-flight IOs submitted by the application
- For HBAs
 - num_cmd_elems defaults to 200 typically
 - Max range is 2048 to 4096 depending on storage vendor
 - As of AIX v7.1 tl2 (or 6.1 tl8) num_cmd_elems is limited to 256 for VFCs
 - See <http://www-01.ibm.com/support/docview.wss?uid=isg1IV63282>

9

Queue Depth

- Try sar -d, nmon -D, iostat -D
- sar -d 2 6 shows:

device	%busy	avque	r+w/s	Kbs/s	await	avserv
hdisk7	0	0.0	2	160	0.0	1.9
hdisk8	19	0.3	568	14337	23.5	2.3
hdisk9	2	0.0	31	149	0.0	0.9

- avque
Average IOs in the wait queue
Waiting to get sent to the disk (the disk's queue is full)
Values > 0 indicate increasing queue_depth may help performance
Used to mean number of IOs in the disk queue
- await
Average time waiting in the wait queue (ms)
- avserv
Average I/O service time when sent to disk (ms)
- See articles by Dan Braden:
 - <http://www-03.ibm.com/support/techdocs/atsmastr.nsf/WebIndex/TD105745>
 - <http://www-03.ibm.com/support/techdocs/atsmastr.nsf/WebIndex/TD106122>

10

hdisk9	0.1	136.5	0	0	136.5	0	0	0	0	0	21.2	21.2	21.2	0	0	0	0	0	

tps Transactions per second – transfers per second to the adapter
avgserv Average service time
Avgtime Average time in the wait queue
avgwqsz Average wait queue size
avgsqsz If regularly >0 increase queue-depth
servqfull Rate of IOs submitted to a full queue per second
Look at iostat -aD for adapter queues
If avgwqsz > 0 or sqfull high then increase queue_depth. Also look at avgsqsz.
Per IBM Average IO sizes:
read = bread/rps
write = bwrtn/wps

Also try
iostat -RDTI int count
iostat -RDTI 30 5
Does 5 x 30 second snaps

11

Adapter Queue Problems

- Look at BBBF Tab in NMON Analyzer or run fcstat command
- fcstat -D provides better information including high water marks that can be used in calculations
- Adapter device drivers use DMA for IO
- From **fcstat** on each fcs
- NOTE these are since boot

FC SCSI Adapter Driver Information

No DMA Resource Count: 0

No Adapter Elements Count: 2567

No Command Resource Count: 34114051

Number of times since boot that IO was temporarily blocked waiting for resources such as num_cmd_elems too low

- No DMA resource – adjust max_xfer_size
- No adapter elements – adjust num_cmd_elems
- No command resource – adjust num_cmd_elems
- If using NPIV make changes to VIO and client, not just VIO
- Reboot VIO prior to changing client settings

12

Adapter Tuning

```
fcs0
bus_intr_lvl          115           Bus interrupt level      False
bus_io_addr           0x0fc00       Bus I/O address        False
bus_mem_addr          0xe8040000   Bus memory address     False
init_link              al            INIT Link flags        True
intr_priority          3             Interrupt priority    False
lg_term_dma            0x800000    Long term DMA         True
max_xfer_size          0x100000    Maximum Transfer Size  True (16MB DMA)
num_cmd_elems          200          Maximum number of COMMANDS to queue to the adapter True
pref_alpha              0x1           Preferred AL_PA        True
sw_fc_class             2             FC Class for Fabric  True

Changes I often make (test first)
max_xfer_size          0x200000    Maximum Transfer Size  True 128MB DMA area for data I/O
num_cmd_elems          1024         Maximum number of COMMANDS to queue to the adapter True
Often I raise this to 2048 – check with your disk vendor
lg_term_dma is the DMA area for control I/O
```

Check these are ok with your disk vendor!!!

```
chdev -l fcs0 -a max_xfer_size=0x200000 -a num_cmd_elems=1024 -P
chdev -l fcs1 -a max_xfer_size=0x200000 -a num_cmd_elems=1024 -P
```

At AIX 6.1 TL2 VFCs will always use a 128MB DMA memory area even with default max_xfer_size – I change it anyway for consistency
As of AIX v7.1 t12 (or 6.1 t8) num_cmd_elems there is an effective limit of 256 for VFCs

See <http://www-01.ibm.com/support/docview.wss?uid=isg1IV63282>

Remember make changes to both VIO servers and client LPARs if using NPIV
 VIO server setting must be at least as large as the client setting

See Dan Braden Techdoc for more on tuning these:
<http://www-03.ibm.com/support/techdocs/atsmastr.nsf/WebIndex/TD105745>

13

fcstat -D - Output

```
lsattr -El fcs8
lg_term_dma 0x800000 Long term DMA      True
max_xfer_size 0x200000 Maximum Transfer Size  True
num_cmd_elems 2048  Maximum number of COMMANDS to queue to the adapter True
```

```
fcstat -D fcs8
FIBRE CHANNEL STATISTICS REPORT: fcs8
.....
```

```
FC SCSI Adapter Driver Queue Statistics
High water mark of active commands: 512
High water mark of pending commands: 104
```

```
FC SCSI Adapter Driver Information
No DMA Resource Count: 0
No Adapter Elements Count: 13300
No Command Resource Count: 0
```

Adapter Effective max transfer value: 0x200000

Some lines removed to save space

Per Dan Braden:
Set num_cmd_elems to at least high active + high pending or 512+104=626

My VIO Server and NPIV Client Adapter Settings

```
VIO SERVER
#lsattr -El fcs0
lg_term_dma      0x800000  Long term DMA          True
max_xfer_size 0x200000 Maximum Transfer Size    True
num_cmd_elems   2048       Maximum number of COMMANDS to queue to the adapter
True
```

```
NPIV Client (running at defaults before changes)
#lsattr -El fcs0
lg_term_dma      0x800000  Long term DMA          True
max_xfer_size 0x200000 Maximum Transfer Size    True
num_cmd_elems   256        Maximum Number of COMMAND Elements True
```

**NOTE NPIV client must be <= to settings on VIO
VFCs can't exceed 256 after 7.1 t12 or 6.1 t18**

15

Tunables

16

vmstat -v Output – Not Healthy

3.0 minperm percentage
 90.0 maxperm percentage
 45.1 numperm percentage
 45.1 numclient percentage
 90.0 maxclient percentage

1468217 pending disk I/Os blocked with no pbuf	pbufs (LVM)
11173706 paging space I/Os blocked with no psbuf	pagespace (VMM)
2048 file system I/Os blocked with no fsbuf	JFS (FS layer)
238 client file system I/Os blocked with no fsbuf	NFS/VxFS (FS layer)
39943187 external pager file system I/Os blocked with no fsbuf	JFS2 (FS layer)

numclient=numperm so most likely the I/O being done is JFS2 or NFS or VxFS
 Based on the blocked I/Os it is clearly a system using JFS2
 It is also having paging problems
 pbufs also need reviewing

17

lvmo -a Output

2725270 pending disk I/Os blocked with no pbuf
 Sometimes the above line from vmstat -v only includes rootvg so use lvmo -a to double-check

```
vgname = rootvg
pv_pbuf_count = 512
total_vg_pbufs = 1024
max_vg_pbuf_count = 16384
pervg_blocked_io_count = 0           this is rootvg
pv_min_pbuf = 512
Max_vg_pbuf_count = 0
global_blocked_io_count = 2725270    this is the others
```

Use lvmo -v xxxxvg -a
 For other VGs we see the following in pervg_blocked_io_count

	blocked	total_vg_bufs
nimvg	29	512
sasvg	2719199	1024
backupvg	6042	4608

lvmo -v sasvg -o pv_pbuf_count=2048 - do this for each VG affected NOT GLOBALLY

18

Parameter Settings - Summary

PARAMETER	DEFAULTS			NEW SET ALL TO
	AIXv5.3	AIXv6	AIXv7	
NETWORK (no)				
rfc1323	0	0	0	1
tcp_sendspace	16384	16384	16384	262144 (1Gb)
tcp_recvspace	16384	16384	16384	262144 (1Gb)
udp_sendspace	9216	9216	9216	65536
udp_recvspace	42080	42080	42080	655360
MEMORY (vmo)				
minperm%	20	3	3	3
maxperm%	80	90	90	90 JFS, NFS, VxFS, JFS2
maxclient%	80	90	90	90 JFS2, NFS
lru_file_repage	1	0	0	0
lru_poll_interval	?	10	10	10
Minfree	960	960	960	calculation
Maxfree	1088	1088	1088	calculation
page_stole_method	0	0 /1 (TL)	1	1
JFS2 (ioo)				
j2_maxPageReadAhead	128	128	128	as needed
j2_dynamicBufferPreallocation	16	16	16	as needed

19

Other Interesting Tunables

- These are set as options in /etc/filesystems for the filesystem
- noatime
 - Why write a record every time you read or touch a file?
 - mount command option
 - Use for redo and archive logs
- Release behind (or throw data out of file system cache)
 - rbr – release behind on read
 - rbw – release behind on write
 - rbrw – both
- log=null
- Read the various AIX Difference Guides:
 - <http://www.redbooks.ibm.com/cgi-bin/searchsite.cgi?query=aix+AND+differences+AND+guide>
- When making changes to /etc/filesystems use chfs to make them stick

20

filemon

Uses trace so don't forget to STOP the trace

Can provide the following information

- CPU Utilization during the trace
- Most active Files
- Most active Segments
- Most active Logical Volumes
- Most active Physical Volumes
- Most active Files Process-Wise
- Most active Files Thread-Wise

Sample script to run it:

```
filemon -v -o abc.filemon.txt -O all -T 210000000
sleep 60
trcstop
```

OR

```
filemon -v -o abc.filemon2.txt -O pv,lv -T 210000000
sleep 60
trcstop
```

filemon -v -o pv,lv

Most Active Logical Volumes

2

3

Asynchronous I/O and Concurrent I/O

24

Async I/O - v5.3

Total number of AIOs in use
 pstat -a | grep aios | wc -l
 Maximum AIOservers started since boot
 servers per cpu True
 NB – maxservers is a per processor setting in AIX 5.3

Or new way for Posix AIOs is:
 ps -k | grep aio | wc -l
 4205

At AIX v5.3 tl05 this is controlled by aio command
 Also iostat -A
 THIS ALL CHANGES IN AIX V6 – SETTINGS WILL BE UNDER IOO THERE
 lsattr -El aio0
 autoconfig defined STATE to be configured at system restart
 fastpath enable State of fast path
 kprocpr 39 Server PRIORITY
 maxreqs 4096 Maximum number of REQUESTS
 maxservers 10 MAXIMUM number of servers per cpu
 minservers 1 MINIMUM number of servers

	True

AIO is used to improve performance for I/O to raw LVs as well as filesystems.

25

Async I/O – AIX v6 and v7

No more smit panels and no AIO servers start at boot
 Kernel extensions loaded at boot
 AIO servers go away if no activity for 300 seconds
 Only need to tune maxreqs normally

```
ioo -a -F | more
aio_active = 0
aio_maxreqs = 65536
aio_maxservers = 30
aio_minservers = 3
aio_server_inactivity = 300
posix_aio_active = 0
posix_aio_maxreqs = 65536
posix_aio_maxservers = 30
posix_aio_minservers = 3
posix_aio_server_inactivity = 300
```

pstat -a | grep aio

```
22 a 1608e 1 1608e 0 0 1 aioPpool
24 a 1804a 1 1804a 0 0 1 aioLpool
```

You may see some aioservers on a busy system

##Restricted tunables

```
aio_fastpath = 1
aio_fsfastpath = 1
aio_kprocpr = 39
aio_multitidsusp = 1
aio_sample_rate = 5
aio_samples_per_cycle = 6
posix_aio_fastpath = 1
posix_aio_fsfastpath = 1
posix_aio_kprocpr = 39
posix_aio_sample_rate = 5
posix_aio_samples_per_cycle = 6
```

26

AIO Recommendations

Oracle now recommending the following as **starting points**

	5.3	6.1 or 7 (non CIO)
minservers	100	3 - default
maxservers	200	200
maxreqs	16384	65536 – default

These are per LCPU

So for lcpu=10 and maxservers=100 you get 1000 aioservers

AIO applies to both raw I/O and file systems

Grow maxservers as you need to

27

iostat -A

iostat -A async IO

System configuration: lcpu=16 drives=15
aio: avgc avfc maxg maif maxr avg-cpu: % user % sys % idle % iowait

150	0	5652	0	12288	21.4	3.3	64.7	10.6
Disks:	% tm_act	Kbps	tps	Kb_read				Kb_wrtn
hdisk6	23.4	1846.1	195.2	381485298	61892856			
hdisk5	15.2	1387.4	143.8	304880506	28324064			
hdisk9	13.9	1695.9	163.3	373163558	34144512			

If maxg close to maxr or maxservers then increase maxreqs or maxservers

Old calculation – no longer recommended

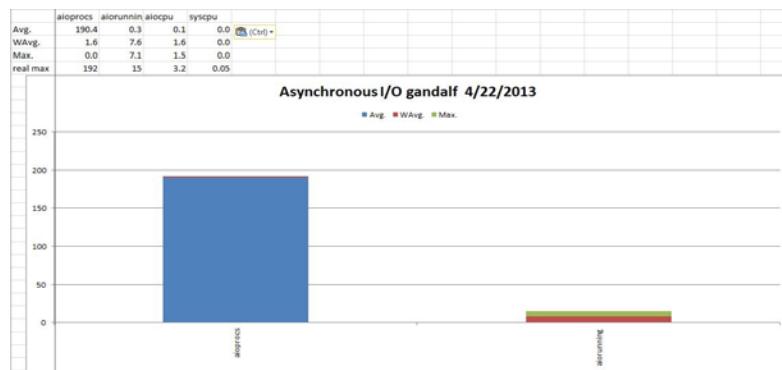

minservers = active number of CPUs or 10 whichever is the smaller number
maxservers = number of disks times 10 divided by the active number of CPUs
maxreqs = 4 times the number of disks times the queue depth

***Reboot anytime the AIO Server parameters are changed

28

PROCAIO tab in nmon

Maximum seen was 192 but average was much less

DIO and CIO

- **DIO**
 - Direct I/O
 - Around since AIX v5.1, also in Linux
 - Used with JFS
 - CIO is built on it
 - Effectively bypasses filesystem caching to bring data directly into application buffers
 - Does not like compressed JFS or BF (lfe) filesystems
 - Performance will suffer due to requirement for 128kb I/O (after 4MB)
 - Reduces CPU and eliminates overhead copying data twice
 - Reads are asynchronous
 - No filesystem readahead
 - No lrud or syncd overhead
 - No double buffering of data
 - Inode locks still used
 - Benefits heavily random access workloads

DIO and CIO

- **CIO**
 - Concurrent I/O – AIX only, not in Linux
 - Only available in JFS2
 - Allows performance close to raw devices
 - **Designed for apps (such as RDBs) that enforce write serialization at the app**
 - Allows non-use of inode locks
 - Implies DIO as well
 - Benefits heavy update workloads
 - Speeds up writes significantly
 - Saves memory and CPU for double copies
 - **No filesystem readahead**
 - **No lru or syncd overhead**
 - **No double buffering of data**
 - **Not all apps benefit from CIO and DIO – some are better with filesystem caching and some are safer that way**
- When to use it
 - Database DBF files, redo logs and control files and flashback log files.
 - Not for Oracle binaries or archive log files
- Can get stats using vmstat -IW flags

31

DIO/CIO Oracle Specifics

- Use CIO where it will benefit you
 - Do not use for Oracle binaries
 - Ensure redo logs and control files are in their own filesystems with the correct (512) blocksize
 - **Use lsfs -q to check blocksizes**
 - I give each instance its own filesystem and their redo logs are also separate
- Leave DISK_ASYNC_IO=TRUE in Oracle
- Tweak the maxservers/AIO settings
- Remember CIO uses DIO under the covers
- If using JFS
 - Do not allocate JFS with BF (LFE)
 - It increases DIO transfer size from 4k to 128k
 - 2gb is largest file size
 - Do not use compressed JFS – defeats DIO

32

lsfs -q output

```
/dev/ga7_ga74_lv-- /ga74          jfs2 264241152 rw    yes no
  (lv size: 264241152, fs size: 264241152, block size: 4096, sparse files: yes, inline log: no,
  inline log size: 0, EAformat: v1, Quota: no, DMAP: no, VIX: no, EFS: no, ISNAPSHOT: no,
  MAXEXT: 0, MountGuard: no)
```

```
/dev/ga7_ga71_lv-- /ga71          jfs2 68157440 rw    yes no
  (lv size: 68157440, fs size: 68157440, block size: 512, sparse files: yes, inline log: no,
  inline log size: 0, EAformat: v1, Quota: no, DMAP: no, VIX: no, EFS: no, ISNAPSHOT: no,
  MAXEXT: 0, MountGuard: no)
```

It really helps if you give LVs meaningful names like /dev/lv_prodredo rather than /dev/u99

33

Telling Oracle to use CIO and AIO

If your Oracle version (10g/11g) supports it then configure it this way:
 There is no default set in Oracle 10g do you need to set it

Configure Oracle Instance to use CIO and AIO in the init.ora (PFILE/SPFILE)
`disk_async_io = true (init.ora)`
`filesystemio_options = setall (init.ora)`

Note if you do backups using system commands while the database is up then you will need to use the 9i method below for v10 or v11

If not (i.e. 9i) then you will have to set the filesystem to use CIO in the /etc filesystems
`options = cio (/etc/filesystems)`
`disk_async_io = true (init.ora)`
 Do not put anything in the filesystem that the Database does not manage
 Remember there is no inode lock on writes

Or you can use ASM and let it manage all the disk automatically
 Also read Metalink Notes #257338.1, #360287.1
 See Metalink Note 960055.1 for recommendations

Do not set it in both places (config file and /etc/filesystems)

34

Demoted I/O in Oracle

- Check w column in vmstat -IW
- CIO write fails because IO is not aligned to FS blocksize
 - i.e app writing 512 byte blocks but FS has 4096
- Ends up getting redone
 - Demoted I/O consumes more kernel CPU
 - And more physical I/O
- To find demoted I/O (if JFS2)

```
trace -aj 59B,59C ; sleep 2 ; trcstop ; trcrpt -o directio.trcrpt
grep -i demoted directio.trcrpt
```

Look in the report for:

JFS2 IO dio demoted:

35

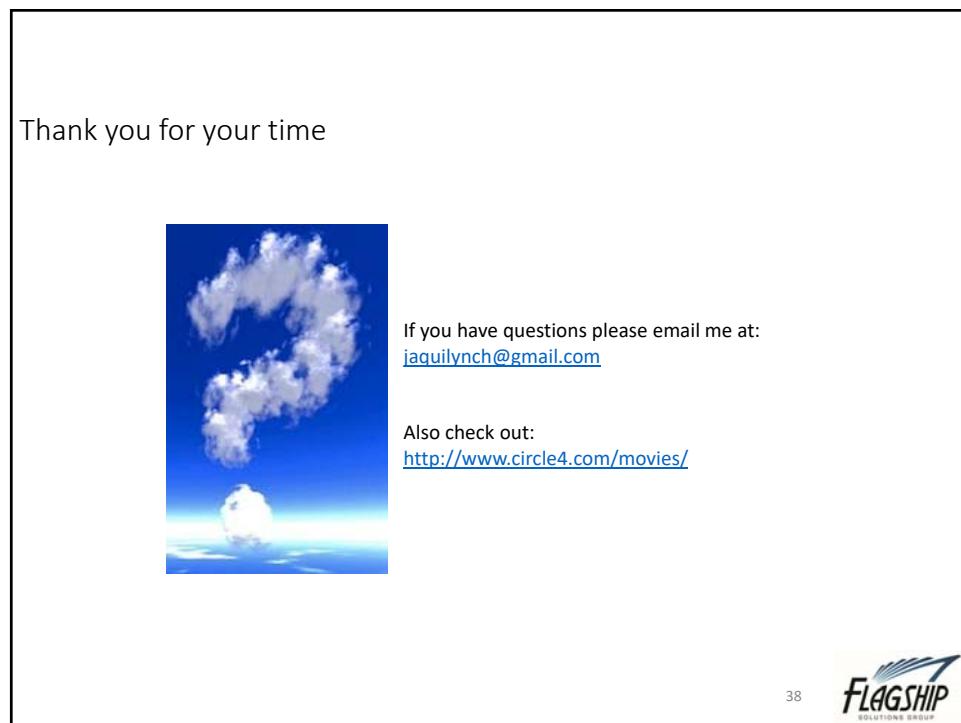

Tips to keep out of trouble

- Monitor errpt
- Check the performance apars have all been installed
 - Yes this means you need to stay current
 - See Stephen Nasypyany and Rosa Davidson Optimization Presentations
- Keep firmware up to date
 - In particular, look at the firmware history for your server to see if there are performance problems fixed
- Information on the firmware updates can be found at:
 - <http://www-933.ibm.com/support/fixcentral/>
- Firmware history including release dates can be found at:
 - Power7 Midrange
 - <http://download.boulder.ibm.com/ibmdl/pub/software/server/firmware/AM-Firmware-Hist.html>
 - Power7 High end
 - <http://download.boulder.ibm.com/ibmdl/pub/software/server/firmware/AL-Firmware-Hist.html>
- Ensure software stack is current
- Ensure compilers are current and that compiled code turns on optimization
- To get true MPIO run the correct multipath software
- Ensure system is properly architected (VPs, memory, entitlement, etc)
- Take a baseline before and after any changes
- DOCUMENTATION

49

I/O Bandwidth – understand adapter differences

- PCIe2 LP 8Gb 4 port Fibre HBA
 - Data throughput 3200 MB/ps FDX per port
 - IOPS 200,000 per port
 - <http://www.redbooks.ibm.com/technotes/tips0883.pdf>
 - Can run at 2Gb, 4Gb or 8Gb
 - PCIe2 8Gb 1 or 2 port Fibre HBA
 - Data throughput 1600 MB/s FDX per port
 - IOPS Up to 142,000 per card

Above are approximate taken from card specifications
Look at DISK_SUMM tab in nmon analyzer
Sum reads and writes, figure out the average and max
Then divide by 1024 to get MB/s

Adapter bandwidth

Adapter Performance Chart

Adapter	FC	IOPS 4K	Sustained Sequential b/w
2 Gbps FC adapter (single port)	5716	38,461	198 MB/s simplex, 385 MB/s duplex
4 Gbps FC adapter (single port)	5758	n/a	DDR slots: 400 MB/s simplex, ~750 MB/s duplex, SDR slots: 400 MB/s simplex, 500 MB/s duplex
4 Gbps FC adapter (dual)	5759	n/a	DDR slots: ~750 MB/s, SDR slots: ~500 MB/s
4 Gbps FC adapter PCI-e	5773	n/a	400 MB/s simplex, ~750 MB/s duplex
4 Gbps FC adapter (dual) PCI-e	5774	n/a	~750 MB/s
8 Gbps FC dual port PCI-e	5735	142,000	750 MB/s per port simplex, 997 MB/s duplex per port 1475 MB/s simplex per adapter, 2000 MB/s duplex per
10 Gb FCoE PCIe Dual Port	5708	150,000	930 MB/s per port simplex, 1900 MB/s per port duplex 1630 MB/s simplex per adapter, 2290 MB/s duplex per adapter
